

ESTUARY

Advanced GeoScience Imaging Solutions

Travel Time Tomography

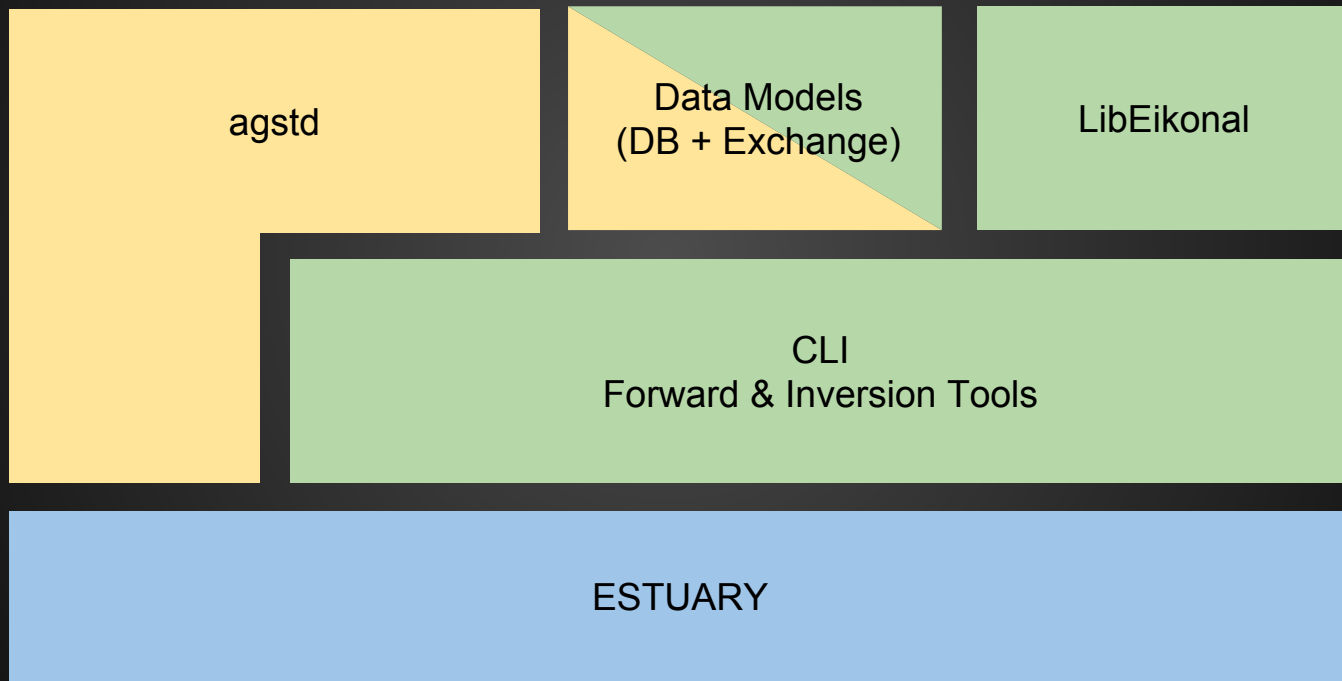

ESTUARY

Provides

- Proven and performance oriented tools for **Forward Modeling** and **Inversion**
- Modular Architecture
- A task-level based parallelization
- Minimal task/target set rebuilding when inversions parameters are modified
- A High Level Python API
- Highly Transparent Process

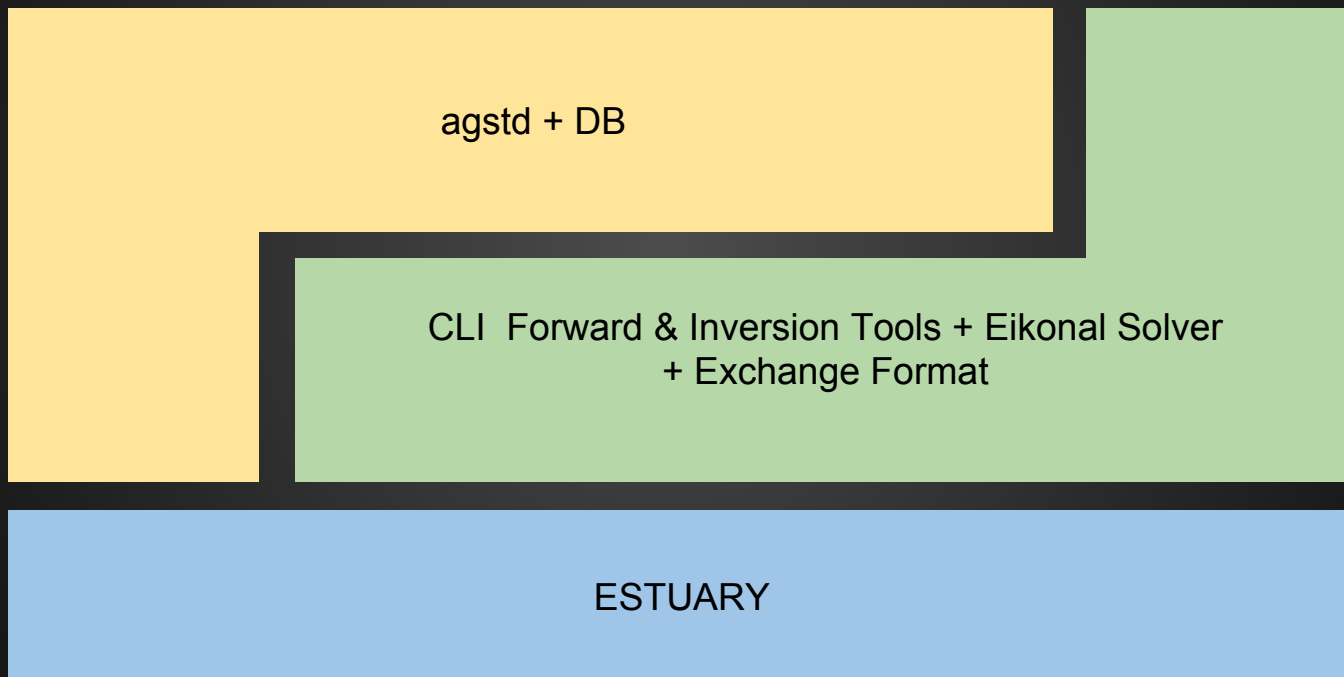

Software Structure

OR WHAT IT SHOULD BE

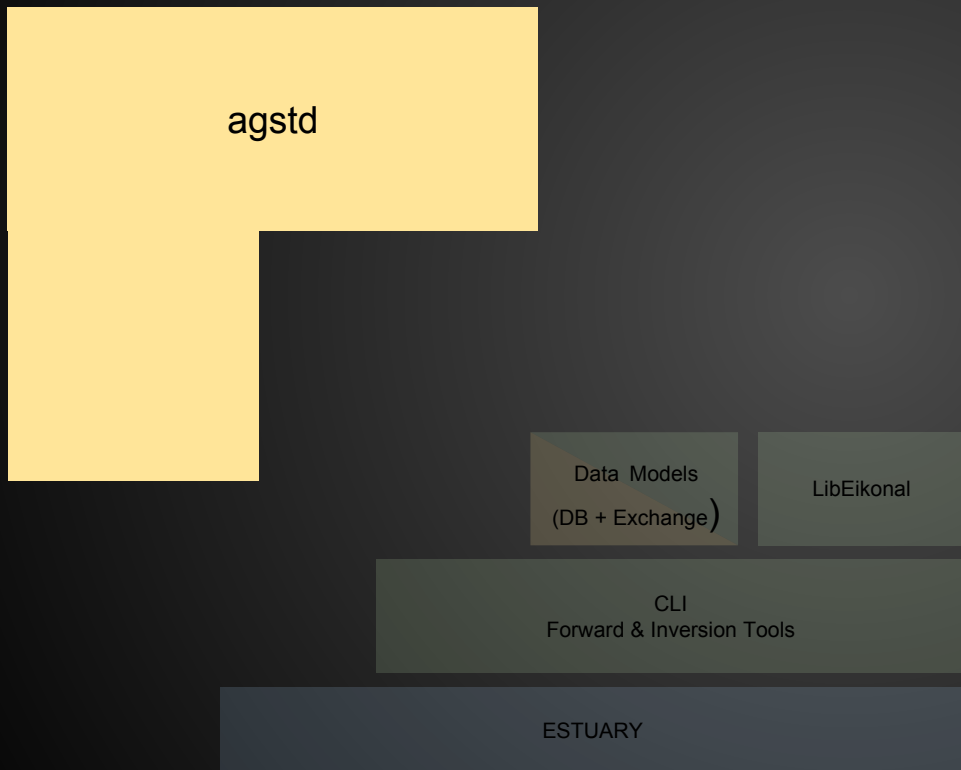

Software Structure

WHAT IT ACTUALLY IS

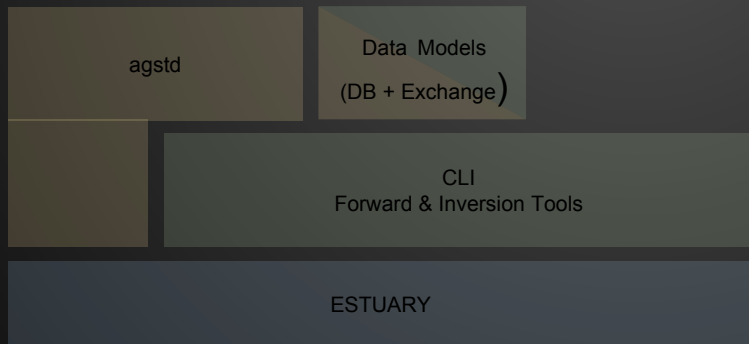

Software Structure

Python base library

- Decorators
- “Main” Utility
- Logging Primitives
- CLI Utility
- Async Programming Tools
- XML
- ...

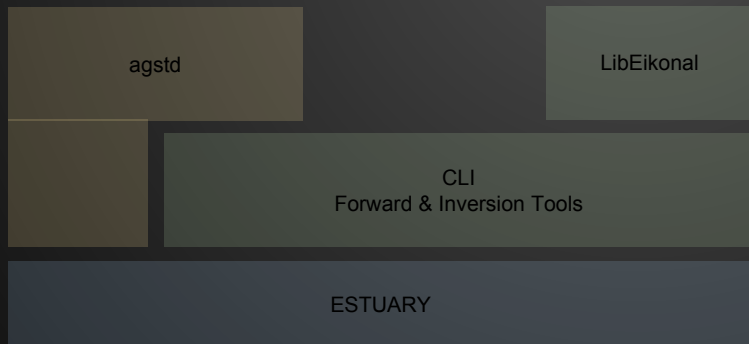

Software Structure

eikonal-ng/templates

- C++ / Python / Cython
- Fast Marching Method EK
- RayTracer
- Python Bindings (in cython)
- Templated Array Library (Homebrewed)
- Schrodinger Equation Based Solver

Software Structure

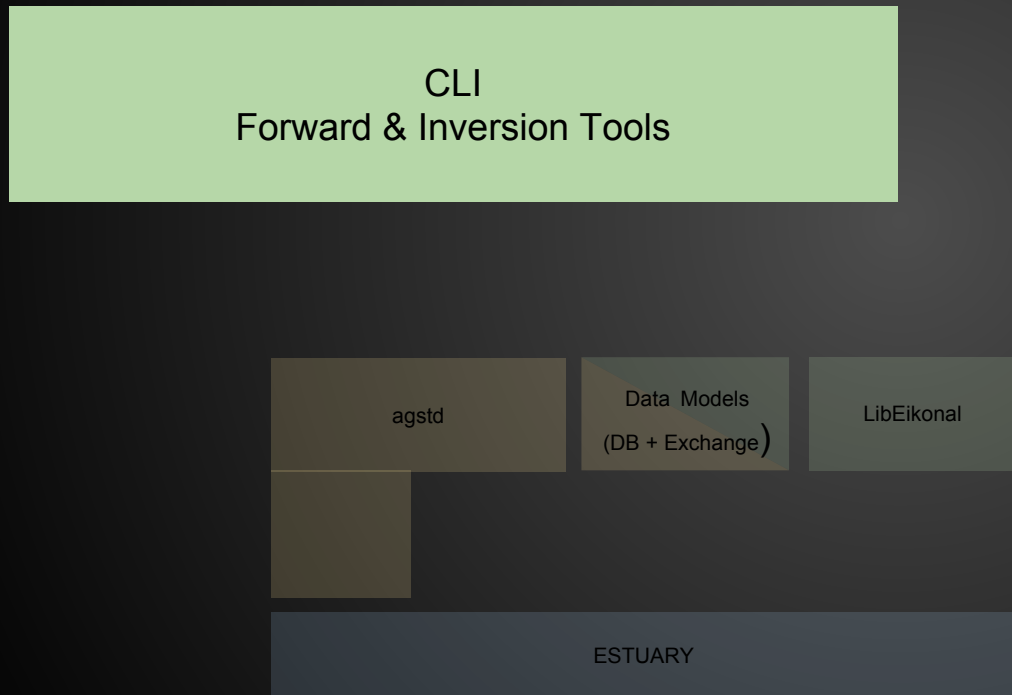

Eikonal-ng (data.py)

- Exchange Formats
(EKTTTable, EKEventTable,
EKStationTable,
EKImageData)

agstd.sdb

- Database Models
sqlite + h5f
- Database Query Builder

Software Structure

Eikonal-ng/bin

- Entirely in Python
- CLI utility following the UNIX philosophy

e.g. `eikonal_solver`, `sensitivity`,
`raytrace`, `double_difference`,
`conjugate_gradient`, `checkerboard`

Software Structure

ESTUARY

The diagram illustrates the software structure of ESTUARY. At the top is a large light blue box labeled 'ESTUARY'. Below it, there are several components arranged in two rows. The first row contains three boxes: 'agstd' (dark brown), 'Data Models (DB + Exchange)' (dark grey with a diagonal line), and 'LibEikonal' (dark grey). The second row contains two boxes: a small dark brown box on the left and a larger dark grey box labeled 'CLI Forward & Inversion Tools' on the right. The 'agstd' box is positioned above the small dark brown box in the second row.

agstd

Data Models
(DB + Exchange)

LibEikonal

CLI
Forward & Inversion Tools

Scons flow based dependency task scheduler

- Python
- Manage dependencies
- Manage Multi-threading
- Ensure Up-to-date target building
- Provide a Simplified Object Oriented Inversion API

ESTUARY - more details ...

Produce lots of data....

~ 450MB / inversions for 24 stations

Uses binary “pickled” structures to pass tables between inversion steps.

can be easily converted to .vtk/.vti as required

ESTUARY - more details ...

Lotic is

Amalgam of SCONS Low Level Target Building tools
over the CLI level toolset

Slopes is

Object Oriented API over Lotic

ESTUARY - Modifications

Synthetic Model :

Good news, it is **easy**

MySQL/MariaDB

Good news, It is ... **Somewhat Easy**

Using Arrival Time Instead of TravelTime

Have deeper implications ... Could be **Hard** or **Medium Hard** (I don't know all the implications yet)

ESTUARY - Synthetic Model

Somewhat Easy Way

Use Scons Target and integrate your own API to create a DB target inside the SConstruct file.

Easiest Way

Build the DB Completely outside and use ESTUARY as usual.

SQLFetchDB - A case Study ...

SQLFetchDB.py (as a template)

Slope.py (Modifications)

Lotic.py (Modifications)
